RESOLVEAI / AI-ASSISTED ESCALATION CONTROL TOWER

Make every escalation visible.
Make every resolution reusable.

Connect customer impact, engineering, QA, and release in one accountable workflow.

Built by Prakash Periasamy | Synthetic prototype data

01 / THE OPPORTUNITY

From status to decision clarity

Connect Jira cases with customer impact and engineering evidence. Reveal stalled handoffs, clarify ownership, and reuse validated fixes.[1,2,3]

02 / THE EXECUTIVE QUESTION

What is at risk?

Who owns the next decision?
What is blocking resolution?
Which proven fix can we reuse?

ONE CASE. ONE ACCOUNTABLE PATH.

01
See the impact
Customer, configuration, downtime

02
Find evidence
Similar cases, logs, proven fixes

03
Clear the hold-up
Owner, blocker, next decision

04
Keep the learning
Validated fix and field confirmation

AI prepares evidence-backed recommendations. People approve decisions and actions.

03 / PROPOSED PRODUCTION ARCHITECTURE

Systems of record	Jira history, approved logs, QA tests, releases, customer impact
Case data model	Case, customer, configuration, fault, fix, and release linked over time
Decision services	Stage metrics, permission-aware retrieval, grounded AI summaries
Working surfaces	Control tower, case briefs, QA/release gates, customer updates

Access control | customer separation | redaction | audit trails | AI evaluation
Human approval before Jira writes or external messages

04 / A BOUNDED 90-DAY PILOT

0-30: map and baseline | 31-60: read-only Jira pilot | 61-90: expert evaluation

Measure triage time, blocked age, repeat incidents, and QA-to-release time. Set targets after baselining.

Next step: a 30-minute workflow review; select one Jira project and escalation class.
