Make every escalation visible.
Make every resolution reusable.

An AI-assisted escalation control tower for customer support, engineering, QA, and release.

THE EXECUTIVE QUESTION

What is at risk? Who owns the next decision? What is blocking resolution?

A ticket says what changed.
Leaders need to know what is stuck.

01

Impact is scattered

Severity alone does not explain customer impact, downtime, release exposure, or recurrence.

02

Handoffs lose context

Support, engineering, QA, and release each hold part of the evidence and next decision.

03

Learning is hard to reuse

A validated fix should be findable when a similar configuration fails again.

Public research basis: field-to-engineering escalation, fast root-cause analysis, and equipment recovery.[2,3]

One accountable path from signal to confirmed fix.

01

See the impact

Customer, configuration, downtime

02

Find evidence

Similar cases, logs, proven fixes

03

Clear the hold-up

Owner, blocker, next decision

04

Keep the learning

Validated fix and field confirmation

AI proposes. People approve.

Every answer links to a case, log, test, or release artifact.

Connect the record. Ground the answer. Gate the action.

01	**Systems of record**	Jira history, approved logs, QA tests, releases, customer impact
02	**Case data model**	Case, customer, configuration, fault, fix, and release linked over time
03	**Decision services**	Stage metrics, permission-aware retrieval, grounded AI summaries
04	**Working surfaces**	Control tower, case briefs, QA/release gates, customer updates

Access control | separation | redaction | audit trails | AI evaluation | approval before actions

Use Jira events and changelogs; validate access, retention, and integration with IT.[4,5]

Prove a narrow workflow before scaling the platform.

0-30 DAYS

Map and baseline

Confirm stages, owners, impact definitions, and baseline metrics.

31-60 DAYS

Read-only pilot

Connect one approved Jira project. Test history, evidence, and executive queries.

61-90 DAYS

Evaluate and refine

Expert-review summaries and proposed actions. Measure reliability and usefulness.

MEASURES TO BASELINE

Triage time | blocked age | repeat incidents | QA-to-release time

Set improvement targets after establishing the baseline.

Could we validate this on one escalation class?

Start with a 30-minute workflow review with support, engineering, QA, and release owners.

THE PILOT ASK

One Jira project. One escalation class. Read-only first.

Explore the attached offline control tower and executive brief.
